                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a spatially-addressable set of single exon nucleic acid probes for measuring gene expression in a sample derived from human breast and BT 474 cells. The method involves contexing the probes with a collection of detectably labelled nucleic acids derived from mixAn of human breast, and then measuring the label bound to each probe of the mixroarray. The probes are useful for encode proteins. They are useful for gene discovery, and for encode proteins. They are useful for gene discovery, and for determining predisposition and/or prognosing breast discass. Gene expression analysis is useful for assessing the toxicity of chamical dynersity of probes for measuring gene expression, with far less bias than expressed sequence tag microarrays. The method is suitable for rapid production of functional information from genomic sequence. The method is suitable for present sequence is a peptide encoded by a single exon nucleic acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                              Peptide #2788 encoded by breast cell single exon nucleic acid probe.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New spatially-addressable set of single exon nucleic acid probes, useful for measuring gene expression in sample derived from human breast, comprises number of single exon nucleic acid probes

The invention relates to a single exon nucleic acid probe for measuring human gene expression in a sample derived from human foetal liver. The single exon nucleic acid probes may be used for predicting, measuring and displaying gene expression in samples derived from human fetal liver. The present sequence is a peptide encoded by a single exon nucleic acid probe of the invention.

expression in human

```
The present invention relates to single exon nucleic acid probes for measuring human gene expression in a sample detrived from human heart (see MAAA1535-ABA41305). The present sequence is a protein encoded by one such probe. The probes may be used for predicting, measuring and displaying gene expression in samples derived from the human heart via microarrays is measuring gene expression, the probes are useful for predicting, diagnosing, grading, staging, monitoring and prognosing diseases of the human heart and vascular system e.g. cardiovascular disease. Note: The sequence data for this patent did not form part of the printed as specification, but was obtained in electronic format directly from WIPO at fite.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human brain expressed single exon probe encoded protein SEQ ID NO: 28243.

The present invention provides a number of single exon nucleic acid probles which are derived from genomic sequences expressed in the human bone marrow. They can be used to measure gene expression in bone marrow samples, which may enable the improved diagnosis and treatment of such as lymphoma, leukaemia and myeloma. The present sequence is a protein encoded by one of the probes of the invention.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention provides a number of single exon nucleic acid probes which are derived from genomic sequences expressed in the human brain. They can be used to measure gene expression in brain cell samples, which may enable the diagnosis and improved treatment of nervous system deasess ento as Albeimer's disease, multiple sclerosis, schizophrenia, epilepsy and cancers. The present sequence is a protein encoded by one of the probes of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Single exon nucleic acid probes for analyzing gene expression in human
brains -

The present invention relates to single exon nucleic acid probes (SENP: see AA131315-AA15756). The present sequence is a peptide encoded by one such probe. The probes are useful for producing a microarray for predicting, measuring and displaying gene expression in samples derived from human placenta. The probes are useful for antenatal diagnosis of human genetic disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Peptide #2847 encoded by probe for measuring placental gene expression

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       16;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention relates to human single exon nucleic acid probes (SENF) see AA110068-AA120459). The present sequence is a peptide encoded by one such probe. The SENFS are derived from human HeLa cells. The SENFS can be used for produce a single exon microarray, which can be used for measuring human gene expression in a sample derived from human cervical epithelial cells. By measuring gene expression, the probes are therefore useful in grading and/or staging of diseases of the cervix, notably cervical cervical cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.
                                                                                                                                                                                                                                                                      Peptide #2749 encoded by probe for measuring cervical gene•expression.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            stegseitta---sitgsetttastegsetttastegsettsasttgsetttasttsset 112

such probe. The probes are useful for measuring human gene expression in a human breast sample, where the probe hybridises at high stringency to a nucleic acid expressed in the human breast. The probes are useful for predicting, diagnosting, grading, staging, monitoring and prognosing diseases of the human breast, particularly those diseases with polygenic actiology. The diseases of the breast, fibrocystic changes, proliferative breast disease and non-carcinoma tumours.

Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from MIPO at fibr.Wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Valuable compounds are isolated from complex mixtures by use of immobilized ligands composed of an anchoring protein and a binding protein. A suitable anchoring protein is yeast FLO1 (associated with flocculation), and a gene encoding a chimeric scFv-FLO1 protein that will anchor in the cell wall of a lower eukaryote, and which binds HCG with high specificity, was produced:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   102 ygnwgckgmgacsnsggiaywstdlfgfyttptnvtlemtg-----yflppqtgsytf 154

FUNCTION: CELL SURFACE GLYCOPROTEIN PROMOTING CELL-CELL CONTACT
TO FACLLITATE MATING. SACCHARDWICES CERENTISIAE A AND ADHA CELL-SELLS
EXPRESS THE COMPLEMENTAR CELL SURFACE GLYCOPROTEINS A-AGGLUTININ
AND ALPHA-, RESPECTIVELY, WHICH INTERACT WITH ONE ANOTHER TO
PROMOTE CELLULAR AGGREGATION DURING MATING.
SUBCELLULAR LOCATION: ATTACHED TO THE MEMBRANE BY A GPI-ANCHOR
                                                                                                             -i- INDUCTION: BY EXPOSITION TO PHEROMONE (A-FACTOR) SECRETED BY THE PROPOSITE MATING TYPE CELLS (TYPE A).

- PROPOSITE MATING TYPE CELLS (TYPE A).

- PRIN: N-GIXCOSYLATED AND O-GIXCOSYLATED.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ALPHA-AGGLUTININ.
ACIDIC REGION, PROBABLY IMPORTANT IN
BINDING TO AGGLUTININS OF TYPE A CELLS.
2 X 40 AA TANDEM REPEATS.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             NAC. .) (1) ENDOGLUCANASES WHICH CUT INTERNAL BETA-1,4-GLUCOSIDIC BONDS;
(2) EXCOELLOBIOSTES THAT CUT THE DISSACCHARIDE ELLOBIOSE
FROM THE NONREDGLING END OF THE CELLULOSE POLYMER CHAIN;
(3) BETA-1,4-GLUCOSIDASES WHICH HYDROLYZE THE CELLOBIOSE AND OTHER SHORT CELLO-OLIGOSACCHARIDES TO GLUGOSE.
-!- CATALYTIC ACTIVITY: HYDROLYSIS OF 1,4-beta-D-glucosidic linkages in cellulose and cellotetraose, releasing cellobiose from the non-reducing ends of the chains.
-!- SIMILARITY: BELONGS TO CELLULASE FAMILY 7 OF GLYCOSYL HYDROLASES).
-!- SIMILARITY: CONTAINS 1 FUNGAL-TYPE CELLULOSE-BINDING DOMAIN (CBD).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          66 VGGYINCYSGNIWDSSICSIDITCASECALEGATYESITGV-----TISGSSLRLN 116
